

All-active final recovery

Each marker pools four drift values; fixed activity and intrinsic width; $n = 4$ distinct cells

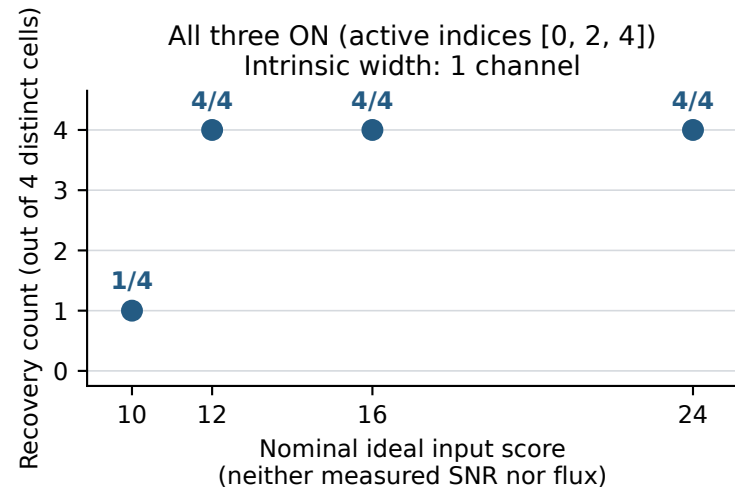

Third ON only (active index [4])
Intrinsic width: 1 channel

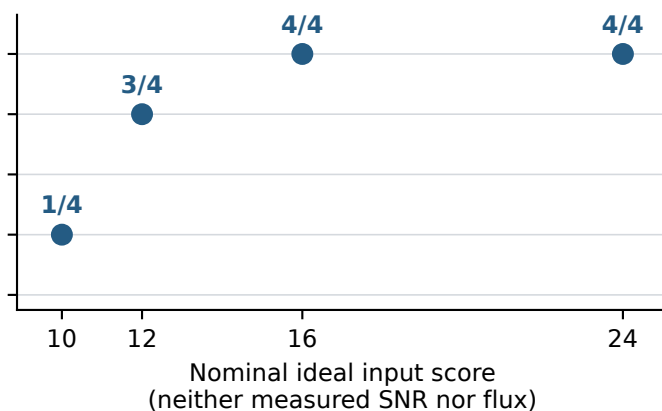

Third ON only (active index [4])
Intrinsic width: 3 channels

All three ON (active indices [0, 2, 4])
Intrinsic width: 1 channel

All three ON (active indices [0, 2, 4])
Intrinsic width: 3 channels

Observed descriptive counts; no probability, confidence interval, or false-alarm estimate.

Nominal ideal input score is neither measured SNR nor flux. Activity groups use independent draws.

With three ON observations, all-active requires all three; any-active requires at least one.
